BACKGROUND

Required for genome-wide de novo methylation and is essential for the establishment of DNA methylation patterns during development . DNA methylation is coordinated with methylation of histones . It modifies DNA in a non-processive manner and also methylates non-CpG sites . May preferentially methylate DNA linker between 2 nucleosomal cores and is inhibited by histone H1 . Plays a role in paternal and maternal imprinting . Required for methylation of most imprinted loci in germ cells . Acts as a transcriptional corepressor for ZBTB18 . Recruited to trimethylated 'Lys-36' of histone H3 (H3K36me3) sites . Can actively repress transcription through the recruitment of HDAC activity . Also has weak auto-methylation activity on Cys-710 in absence of DNA .
